

2012 January 18th

LBA report by James M Anderson

After doing test observations to measure the station response to Cas A and Cyg A prior to the new beamformer calibration tables (to be installed January 23rd), I looked at the spectral response of the LBA dipoles, using `rspctl --statistics`

The following RCUs had significantly low responses:

72, 78, 130, 138, 148, 150, 152, 178
