LBA report by James M Anderson

After doing test observations to measure the station response to Cas A and Cyg A prior to the new beamformer calibration tables (to be installed January 23rd), I looked at the spectral reponse of the LBA dipoles, using rspctl --statistics

The following RCUs had signficantly low responses:

72, 78, 130, 138, 148, 150, 152, 178
