

## **Purpose**

The aim of the test is to verify conversion of linear polarization with PolConvert yields comparable results to native circular.

## **Test setup**

Effelsberg will co-observe at C-band with a set of EVN stations and will be switching between Cx (linear) and the 6cm receiver (circular). The data will be correlated at JIVE and the results will be compared.

The test will be carried out on June 14th 2020 UT 5-11.
